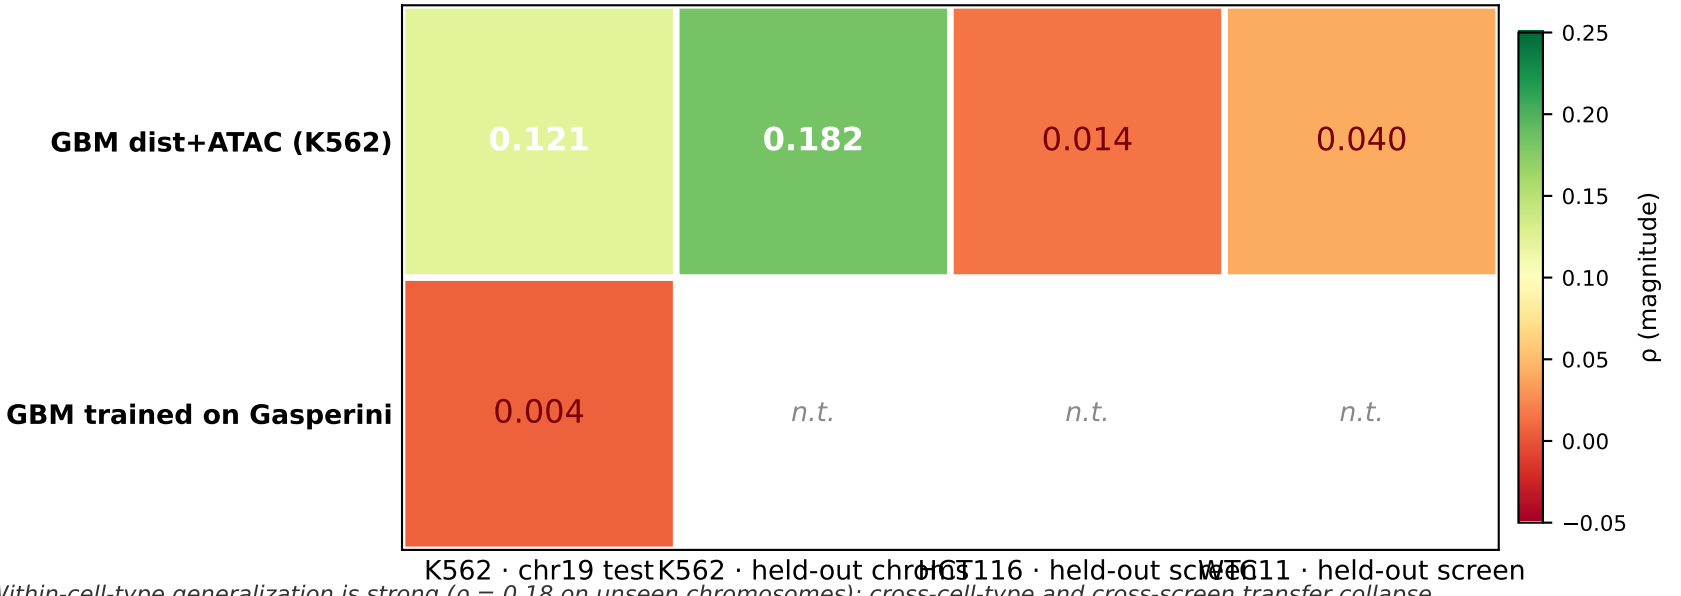
Spearman ρ on |CRISPRi effect| — signal survives only within the training cell type and screen

The specificity wall



Within-cell-type generalization is strong (ρ = 0.18 on unseen chromosomes); cross-cell-type and cross-screen transfer collapse.
Enformer ISD deltas: Δρ −0.275 [−0.21, +0.13] (powered, pre-registered). Cross-screen ensemble underperforms the native model (0.058 < 0.106).
